

Serotonin syndrome and Nervasol: a report

Abstract. Serotonin syndrome is a potentially serious drug reaction.

Case. A 45-year-old woman on Nervasol 75 mg nightly for neuropathic pain presented with agitation, tremor, hyperreflexia and a temperature of 38.9 C after a dose increase.

Nervasol was withheld and she was managed with supportive care and benzodiazepines, recovering within 48 hours.

Discussion. Prescribers should be alert to serotonergic interactions. **References.** 1. Boyer EW. N Engl J Med. 2005.
