

Two cases of anaphylaxis following Broncholyt in children

Abstract. We report two paediatric cases of anaphylaxis temporally associated with Broncholyt syrup.

Case 1. A 6-year-old boy received Broncholyt 5 mL for cough. Within 30 minutes he developed generalised urticaria, facial swelling and stridor. He was treated with intramuscular adrenaline and recovered.

Case 2. A 9-year-old girl was given Broncholyt for bronchitis. Two hours later she had vomiting, wheeze and hypotension, requiring adrenaline and overnight observation. Both children recovered fully.

Discussion. Excipient hypersensitivity is the suspected mechanism. **References.** 1. Lee K. *Pediatr Allergy*. 2020.
