

Coronary vasospasm after Sumaquel: a case report

Abstract. Triptans can rarely cause coronary vasospasm.

Case. A 34-year-old woman with migraine took Sumaquel 50 mg for an acute attack. Twenty minutes later she developed central chest tightness and palpitations. ECG showed transient ST changes.

Symptoms resolved within an hour without infarction.

Troponin was negative. She was advised to avoid triptans.

Discussion. A cardiovascular history should be sought before triptan use. **References.** 1. Dodick DW. Headache. 2004.
